

Logs of communication

KP Keenan Phillips 27/09 6:10 pm Edited

P03-02

Hey everyone, since we don't have class today I just thought I'd update you all on current progress. I've needed to add two new user stories - Register a new pet, and View all registered pets. I wasn't aware that these weren't included (as they're an integral part of the app), so I'm happy to take on the extra workload. The good news is I've completed the implementation for both user stories - just unit testing is left to implement!

Additionally, I've also fixed up the Booking Appointments feature. It should now display a list of all appointments that only belong to the logged-in user and the user is now able to properly edit and delete their appointments as well (before there were issues). There were also various back-end issues that I've fixed (such as the PetID not being registered to the appointment, many more). Lastly, I've cleaned up the code throughout our codebase so it's more consistent with JPA naming conventions. There may still be some errors so please let me know!

I've removed selecting the vet name and clinic as these are currently out of scope for our application. I've also added basic error handling for booking appointments (cannot book a date that's in the past, cannot book for hours outside of operational hours (8 am - 7 pm) - this will be added to the user guide.

I've also repurposed my previous assigned story "Viewing pets medical information" into "Viewing pets medical records". Along with the previously mentioned pet stories, the "pet" section is now complete and provides a good overview of a registered pet's medical history, along with a basic but intuitive view.

There are still various issues with the editing of a user's personal information if someone wanted to take a look at that. As always, if anybody is in need of some help, please reach out and I'd be more than happy to help!

The code has been pushed to main - please pull these changes and test out the app ASAP so I know what to fix. I'll spend the remainder of the time writing unit tests for my assigned stories and working out Docker and how to host it.

Also, if you were writing unit tests, you may need to re-write them to follow the updated code.

See you guys soon!

Feedback session with Dale

P03-02

Hey guys, I sent Dale an email and we had a discussion on MS Teams about our Milestone 2 submission. Below are some key points of the feedback. We've lost marks for all the below points.

- We got just over half marks for it (assuming 7.5-8/15)
- Database migrations did not work when Dale attempted to run the assignment.
- Remove "register as a vet" from the login page - anybody can register as a vet when they should be registering as a user by default, and then have an "admin" upgrade the user to a vet role.
 - Advised Dale that this may be out of scope of the current sprint.
- Login and Register pages have to be cleaned up - "Don't have an account? Register"
- Login button appears when user is logged in.
- Logout button appears when user is not logged in.
- "Appointments" should be a separate tab in the navbar.
- When editing an appointment, current appointment details (e.g., time, date) should auto-fill.

P03-02

Hey everyone! I've just finished the Order Prescriptions user story and pushed it to my repository "prescriptions" I would appreciate if someone could review the code before I mark it as done 😊. I've also updated the user guide to explain how to run and develop with Docker, so take a look at that if you can't get anything working.

Lastly, I've made additions to the database migrations in the main branch to include a test user. It has the credentials "e: test@test, p: test". You should be able to see an example of prescriptions (since there is currently no way for a veterinarian to give out a prescription).

Keenan Phillips, **Seanghai Heng** you will face flyway migration conflicts, if you delete the database volume and container, then run "docker-compose build", everything should work again. As shown in the attached video.

The screenshot shows the Docker Desktop application window. On the left is a sidebar with navigation options: Containers, Images, Volumes, Builds (marked NEW), Dev Environments (marked BETA), Docker Scout, Extensions, and Add Extensions. The main panel is titled 'Containers' and shows a summary of container CPU and memory usage, both indicating 'No containers are running'. Below this is a search bar and a toggle for 'Only show running containers'. A table lists containers with columns for Name, Image, Status, CPU (%), Port(s), Last started, and Actions. Two containers are listed: 'act-Team-Group-PX' with status 'Exited (137)' and 'team-project-group' with status 'Exited'. A large video player overlay with a play button is centered over the table.

Hey again everyone! I've just been working on cleaning up the GitHub project and documentation. I've made the following changes:

- Ticked DoD on finished tasks that work
- Closed issues as done from completed user stories and tasks
- Changed task and user story status where they are incorrectly marked (e.g. should be marked done, or marked as done when not all tasks are finished)
- Marked any tasks outside of sprint 2 as not planned (I assume they're all cancelled)
- Added GitHub issues as bugs for everything dale mentioned regarding the program and added them to the current sprint

Tomorrow after the meeting I'll see if I can finish as many of the bugs as I can!

WD

Dale sent out an email, I'm at work the whole day so I can't.

> Many of my groups have missed out on meetings for the last two weeks. Very few people attended the make up classes for the missing AFL Grand Final day classes, and many people were busy doing the challenge last Friday so almost no consultation there either.

>

> Given that our next classes are on Friday you won't have much time for me to give you feedback from the Milestone 2 marking (not released yet).

>

> I urge each team to make an appointment with me (via email or just turn up b/w 2:30 and 5:30 and I can figure out a time slot) where I can help you improve your project before the final submission.

>

> There were a number of submissions that simply didn't work - you really need to chat to me to find out if yours was one of them. Don't assume that your team wasn't one of them.

>

> I have two more assignments to mark so I'll be looking at my email from 12:30 onwards.

Monday 2:02 pm

I can send him through an email, I can probably only do it on MS teams though and not in person

Monday 4:18 pm

Everyone hey guys, just had a call with dale about our feedback. please look at the post in the group, i've outlined everything there

Hey guys, just some important usage points on the app.

1. I've created a 'backup.sql' file that has a **stable** version of our database, with all migrations completely fixed.

2. In order to run the app, please do not delete volumes. Instead, pull the repository, ensure the MySQL database on docker is running in the background, and then use the following command to apply the 'backup.sql' file:

Windows:

</> Shell

Get-Content ".\backup.sql" | docker exec -i team-project-group-p03-02-database-1 mysql -u root vetcare

or

</> Shell

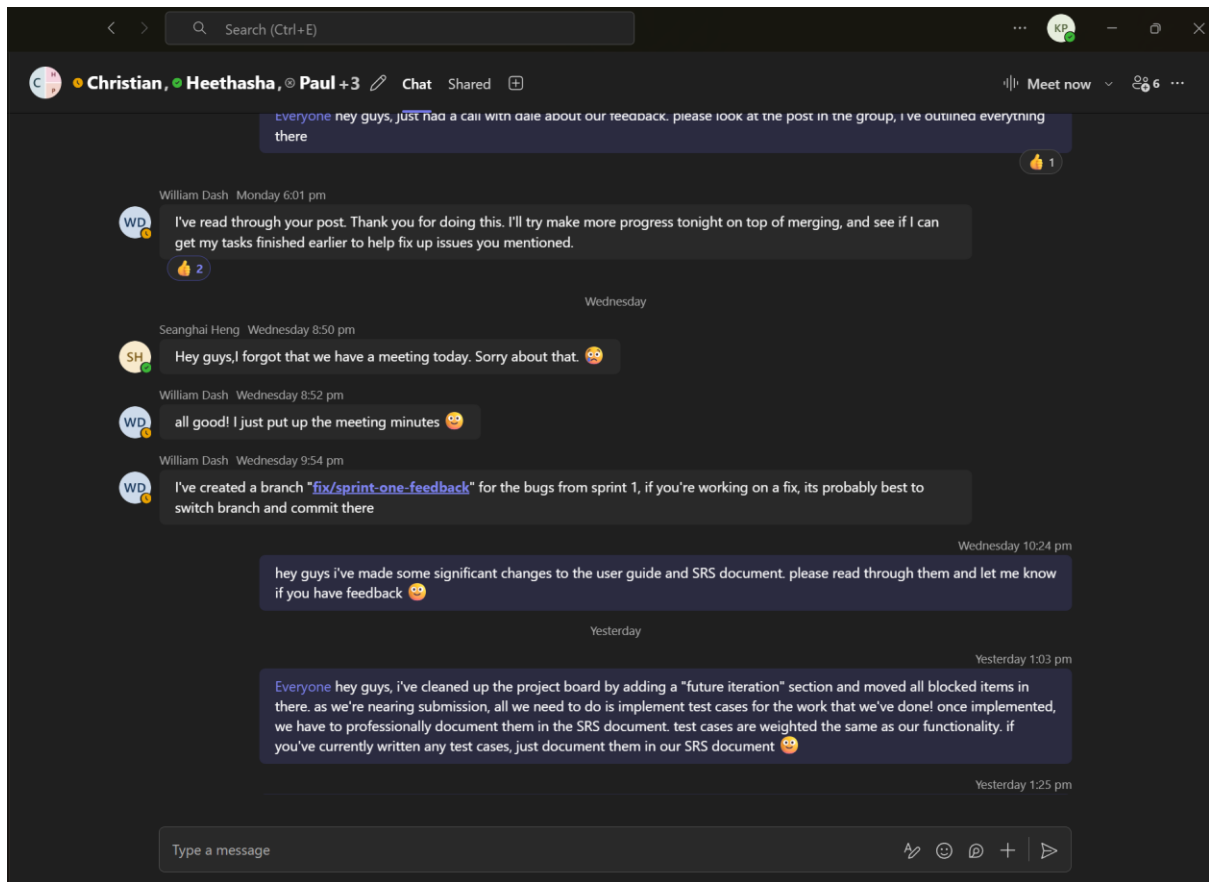

cat ./backup.sql | docker exec -i team-project-group-p03-02-database-1 mysql -u root vetcare

Mac:

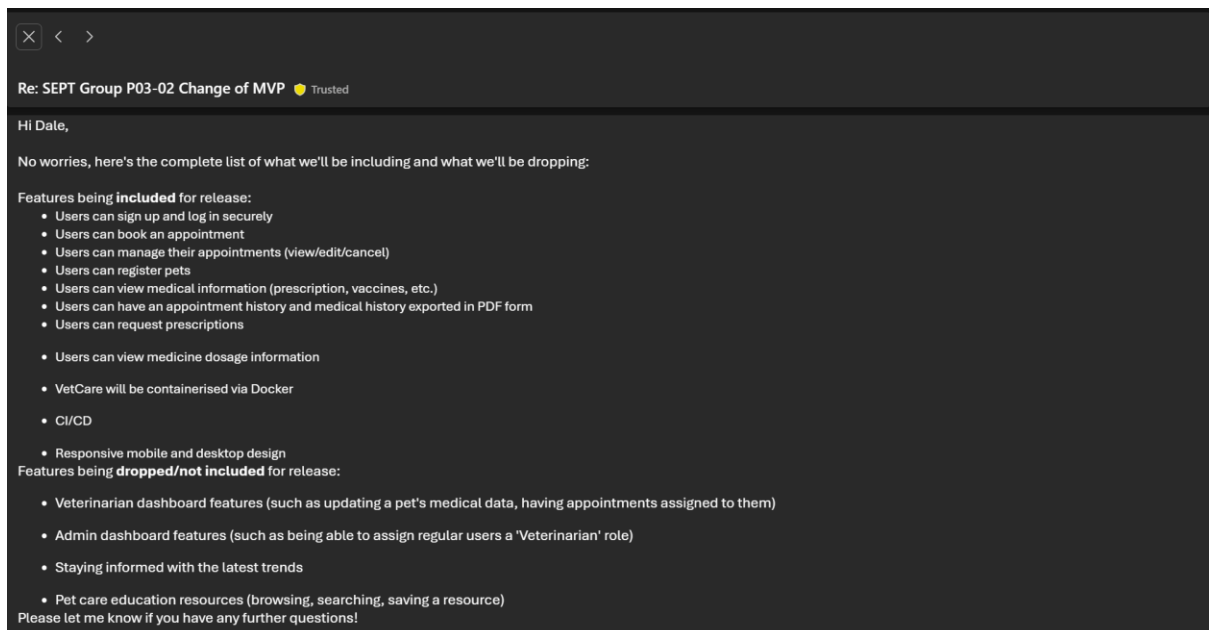

</> Shell

mysql -u root vetcare < ./backup.sql

This has a stable version of the database with all test data there, which is intended for Dale to use. The credentials are the same as what William provided; test@test.test. Before submission, we need to all be able to run the app, so if you have time, please do so before tonight's
